HAVER & BOECKER

ENERGY POLICY

HAVER & BOECKER has set up an energy management system and sees it as its duty to continuously improve this and its energy-related performance in an ongoing process. This is based on DIN EN ISO 50001. We implement the requirements it contains in compliance with standards and continuously improve our processes within the energy management system.
As part of our energy policy, we set energy-related targets, evaluate them and draw up the resulting action plans. In this context, HAVER & BOECKER OHG Management ensures that an appropriate ratio of necessary resources and information are made available in order to maintain and expand the energy management system and to achieve the (energy) targets that have been set.

In addition to the legally applicable requirements, our energy policy takes into account guidelines regarding energy efficiency, energy use and energy consumption that go beyond these.

We support the procurement of energy-efficient products, systems and components as well as services, insofar as these have an impact on energy-related performance. We also support those design-related activities in particular that can have an impact on energy-related performance in our company.

We ensure the continuous improvement of the energy management system and energy-related performance of HAVER & BOECKER OHG by actively involving the entire workforce in the implementation of the energy policy in addition to having a designated energy team. This happens across all levels of HAVER & BOECKER OHG using appropriate documentation and communication.
